Transformation de la classe à expliquer

L'objectif ici est de remplacer les "o" par -1 et les "n" par 1 afin de faire les matrices de confusion avec la fonction dédiée de scikit-learn.

In [6]:

```
y_transform_Shuttle = y_brut_Shuttle
y_transform_Shuttle = np.where(y_transform_Shuttle=='o',-1,1)
#y_transform
y_transform_KDD99CUP = y_brut_KDD99CUP
y_transform_KDD99CUP = np.where(y_transform_KDD99CUP=='o',-1,1)
#y_transform_KDD99CUP
```

Shuttle

Exécution de Isolation Forest sur le jeux de données Shuttle en faisant varier n_estimators

Etude de l'inconstance de IForest

Utilisant les valeurs par défaut des paramètres de IForest au niveau de scikit-learn

```

Conclusion

Malgré le caractère aléatoire de IForest, les métriques choisis ont tendance à être constant durant l'exécution successive avec les mêmes paramètres.

```

No handles with labels found to put in legend.

In [27]:

```
import matplotlib.cm as cm
plt.scatter(specificity_IF_Shuttle,recalls_IF_Shuttle, c=n_estimators_IF_Shuttle, cmap=cm.hsv)
cbar= plt.colorbar()
plt.show()
```

Résultat

Faisant varier $n_estimators$ et $max_samples = 256$, $contamination = 0,1$

L'augmentation du nombre d'arbres augmente le temps d'exécution. L'écart est léger la AUC est aléatoire avec quelques pics. Quelque soit le nombre d'estimateur, la AUC > 0,94

Meilleure estimation :

- Temps = 2.9633030891418457
- ROC AUC = 0.954597443146584 à $n_estimators : 80 ==> 15 * 5 + 5$

Le nombre d'estimateur a une influence sur la performance de IForest pouvant l'améliorer comme la détérioré. Cela s'explique par le caractère aléatoire de la construction de l'arbre.

Exécution de Isolation Forest sur le jeux de données Shuttle en faisant varier max_samples

No handles with labels found to put in legend.

Résultat

Faisant varier max_samples, n_estimators = 100, contamination = 0,1

Plus le nombre d'éléments dans l'échantillon augmente, plus le temps d'exécution est long. Par contre, quelque soit max_samples, la AUC ne varie pas beaucoup : entre 0,950 et 0,958.

Meilleure estimation :

- Temps = 3.8525819778442383
- ROC AUC = 0.958660553678761 à max_samples : 1610 ==> 16 * 100 +10

Max_samples n'a donc pas une grande incidence sur les performances de classification de IForest pour un jeu de données de taille et de dimension faibles. Mais il a une conséquences sur le temps d'exécution.

Interprétation du résultat de IsolationForest sur Shuttle

Faisant varier n_estimators

L'augmentation du nombre d'arbres augmente le temps d'exécution. L'écart est léger la AUC est aléatoire avec quelques pics.

Meilleure estimation :

- Temps = 3.8525819778442383
- ROC AUC = 0.954597443146584 à n_estimators : 80 ==> 15 * 5 + 5

Faisant varier max_samples

Plus le nombre d'éléments dans l'échantillon augmente, plus le temps d'exécution est long.

Meilleure estimation :

- Temps = 3.8525819778442383
- ROC AUC = 0.958660553678761 à max_samples : 1610 ==> 16 * 100 + 10

Faisant varier contamination

Meilleure combinaison entre n_estimators et max_samples

Meilleure combinaison entre n_estimators et contamination

Meilleure combinaison entre max_samples et contamination

Meilleure combinaison entre max_samples, n_estimators et contamination

Interprétation des résultats en fonction du Temps d'exécution, précision, rappel, score f1, AUC sur Shuttle

IsolationForest a eu de meilleures performances que les autres. Entre OC-SVM et LOF : OC-SVM a découvert et bien classé plus d'anomalies que LOF. Par contre, LOF a découvert et bien placé plus d'observations normales que OC-SVM. La question est donc de savoir ce qui importe le plus entre la découverte des anomalies et celle des observations normales car c'est en fonction de l'importance que nous donnons à l'un ou à l'autre que nous pourrions dire la méthode la

meilleure entre OC-SVM et LOF. Cette question fait remarquer qu'en réalité, toutes les méthodes ont sont performantes dans des conditions données en fonction de ce que l'on souhaite obtenir comme résultat. Dans ce cas précis, OC-SVM lance beaucoup de fausse alertes mais attrappe beaucoup d'anomalies. Par contre, LOF n'attrappe pas beaucoup d'anomalies mais reconnais beaucoup de données normales. On peut peut-être se dire que dans le cas espèce OC-SVM est mieux dans la mesure où une méthode de détection d'anomalies a pour but principal de détecter les anomalies et donc laisser passer des anomalies en ferait une méthode moins bonne et que les observations normales que OC-SVM aurait classé comme anormales sont peut être des nouveautés. Considérant l'aire sous la courbe ROC, nous avons l'ordre suivant IForest - OC-SVM et LOF

Tableau du résultat $TOBC = VN/(VN + FP)$ $TNBC = VP/(FN + VP)$

Méthode	Précision	Rappel	Score f1	AUC	TOBC	TNBC	CPU Time
---------	-----------	--------	----------	-----	------	------	----------

IForest n	0.9996652						
	0.9170578	0.95658143	0.9505562	0.9840546	0.9170578	3.8581349	

IForest max	0.9999043						
	0.9172333	0.95678638	0.9563387	0.9954444	0.9172334	5.2929310	

IForest n et max	0.9998804						
	0.9172114	0.95676349	0.9557583	0.9943052	0.9172114	5.4647560	

OC-SVM	0.9982955						
	0.6038696	0.75253208	0.7751694	0.9464692	0.6038696	253.67078	

LOF	0.9870807

Interprétation de la courbe ROC

La courbe ROC mesurant le taux de faux positif par rapport au taux de vrai positif, plus la courbe s'éloigne de celle oblique en noir, mieux c'est. Ainsi, on peut dire que pour Shuttle, IForest est la meilleure méthode de détection d'anomalies suivi par OC-SVM. Le classement de LOF pourrait s'expliquer par le fait que les anomalies qui y sont présentes sont des anomalies global alors que LOF est doué pour les anomalies locales. POur vérifier ça peut être qu'on peut utiliser une méthode de clustering comme K-means pour voir comment les anomalies seront classées par cette méthode.

Conclusion Shuttle

Pour un jeu de données statique de faible dimension, Isolation forest a tendance à mieux performer et semble être plus rapide que OC-SVM et LOF. OC-SVM détecte beaucoup d'anomalies avec un fort taux de fausses alertes et un temps d'exécution plus grand que LOF. Par contre, LOF détecte moins d'anomalies avec un faible taux de fausses alertes. Notons que la performance des méthodes dépends non seulement du jeu de données considéré mais aussi des valeurs des hypermaramètres. Pour LOF et IsolationForest, le temps d'exécution semble être en corrélation positive avec respectivement le nombre de voisins et nombre de d'estimateurs. Par contre, le temps d'exécution serait en corrélation négative avec nu.
